Install Northwind Commerce

Before you begin

You need a server with 4 GB of memory, PHP 8.2 or newer and a MySQL 8 database.

Install

1. Download the release archive and unpack it into your web root.
2. Point your web server at the `public/` directory.
3. Run `bin/northwind install` and answer the database prompts.
4. Open the address you configured; the setup wizard takes over from there.

After the install

Set a cron entry for `bin/northwind schedule:run` every minute — order mail, stock sync and the nightly report all depend on it.
